

Built for Performance. Maintained for Confidence.

Every minute matters in a busy operating room. Equipment readiness supports efficient case flow. OR nurses and Sterile Processing staff carry more responsibility for that readiness than any single title reflects. Instruments have to be complete. Trays have to be ready. Equipment has to perform exactly as expected, every time, so the surgeon and the team can stay focused on the patient.

Innovative Medical Products (IMP) was built around that reality. Since 1984, IMP has been a trailblazer in crafting intuitive surgical positioning devices — built for precision and stability, and designed to keep your OR moving. Preventative maintenance is how that performance stays consistent, case after case.

Wear Doesn't Announce Itself

Normal use creates normal wear. Every positioner absorbs it over time: carriage tension shifts, boot components loosen, locking mechanisms lose some of their original hold. **None of it looks urgent day to day, which is exactly why it is easy to put off addressing until it becomes a problem in the room.**

Left unaddressed, small variances compound. What begins as a minor inconsistency in equipment can become a mid-case delay, a scheduling problem, or, over time, a full replacement where a routine repair would have done the job. Restoring stability and protecting operational flow starts with catching wear before it disrupts the case.

Where Precision Meets Partnership.

An IMP preventative maintenance visit is a full inspection of the components that matter most to positioning performance. It is performed by a specialist who knows the equipment because IMP built it. The goal is simple: identify wear before it disrupts operational flow, and keep your equipment ready for every case.

The Cost of Disruption

When equipment falls short of expectations, or requires full replacement over what should have been a minor repair, the impact moves quickly through the department. Case preparation takes longer. Planning becomes less predictable. Attention shifts toward troubleshooting instead of patient care. Over time, those disruptions accumulate in ways that are both operationally and financially significant.

Durability and life cycle support ultimately define the true value of any equipment investment. Equipment selected for upfront savings may perform well initially, yet limited warranty coverage or restricted repair options can shift risk back to the facility. A single failed component can turn what looked like a minor issue into unplanned capital expense, added coordination, and growing frustration for the team tasked with keeping surgical flow on schedule.

Support responsiveness shapes that experience just as much as the equipment itself. When questions arise or service is needed, delays or unclear points of contact only extend the disruption. This is exactly the gap IMP's superior service team is built to close.

Inspect. Protect. Perform. Prepare.

OR staff consistently say they are looking for a **dedicated partner who already knows the equipment, not a vendor who shows up only when something breaks.**

Every IMP preventative maintenance visit is built around the same four priorities: wear inspected before it affects performance, equipment life protected, OR workflow supported, and your department prepared before delays happen.

Every visit is also documented in a clear written summary: what was found, what was addressed, and what to expect going forward resulting in a dependable, reproducible record of equipment condition.

Inspect

Identify wear before it affects performance.

Protect

Extend equipment life and maintain reliability.

Perform

Support efficient OR workflow when it matters most.

Prepare

Plan ahead and avoid unexpected delays.

Reliability Starts Before the Case

Prepare now for the procedures ahead.

Whether used daily or periodically, proactive inspections help support optimal performance. And as the busiest stretch approaches, the equipment that has already been through this process is the equipment your team will not have to think twice about.

IMP's preventative maintenance program brings together everything this piece has covered: routine inspection, dependable support from a representative who knows your OR, and a documented record of what was done and why. It is not a single transaction. It is the ongoing partnership IMP has built its business on since 1984. Positioned to perform, one visit at a time.

Schedule a free IMP preventative maintenance to review your equipment, identify potential issues, and help your team maintain proper setup, handling, and performance before it becomes a disruption you have to work around.

Protect the Precision Your OR Depends On.
